Key insights

1. **Delivery works.** 77.87% of shipments are delivered in about 4 days. Only 4.17% (626 shipments) are lost or returned to sender.
2. **Couriers match on speed, not on returns.** Lead time is 3.97 to 4.03 days for all five, but return rates run from 7.01% (2GO) to 8.81% (NinjaVan).
3. **J&T is the weakest courier.** Lowest delivered rate (76.59%) and highest lost rate (1.25%).
4. **We cause most returns.** 844 of 1,200 returns come from defective items, missing parts, late delivery, wrong item or damage. No single reason dominates (160 to 182 each).
5. **Category is not the driver.** Return rates only range from 7.47% to 8.65%.

Recommendations

1. **Add a quality and packing check before dispatch** (top priority). Cutting operations-caused returns by one third would bring the return rate from 8.00% to about 6.1%.
2. **Run a monthly courier scorecard** (top priority). Review NinjaVan, J&T and GrabExpress, which are above the 8.00% average.
3. **Reduce lost and failed deliveries,** starting with J&T.
4. **Set a delivery time target** (for example 5 days or less). About 43% of deliveries take 5 to 7 days.
5. **Improve data capture** (delivered date, logical date order, refund fields).

Data note: the data is synthetic. 558 delivered shipments have no delivered date, and many shipments are dated before their order date, so lead time results need care. This is a descriptive analysis: it shows where returns happen, not proven causes.
